

# UNIFORM RANDOM NUMBER GENERATORS FOR SUPERCOMPUTERS

RICHARD P. BRENT

## ABSTRACT

We consider the requirements for uniform pseudo-random number generators on modern vector and parallel supercomputers, consider the pros and cons of various classes of methods, and outline what is currently available. We propose a class of random number generators which have good statistical properties and can be implemented efficiently on vector processors and parallel machines. A good method for initialization of these generators is described, and an implementation on a Fujitsu VP 2200/10 vector processor is discussed.

## COMMENTS

Only the Abstract is given here. The full paper appeared as [1]. Related theory is given in [2]. For work on normally distributed random numbers, see [3].
